### Solutions

SUBJECT : MATHS  
DPP NO. :1

### Topic :- CO-ORDINATE GEOMETRY

1 (a)

$$\begin{aligned} & a^2(\cos^2 B - \cos^2 C) \\ & \quad + b^2(\cos^2 C \\ & \quad - \cos^2 A) \\ & \quad + c^2(\cos^2 A \\ & \quad - \cos^2 B) \\ & = a^2(1 - \sin^2 B - 1 + \sin^2 C) + b^2(1 - \sin^2 C - 1 + \sin^2 A) \\ & \quad + c^2(1 - \sin^2 A - 1 + \sin^2 B) \\ & = a^2(\sin^2 C - \sin^2 B) + b^2(\sin^2 A - \sin^2 C) + c^2(\sin^2 B - \sin^2 A) \\ & = k^2 a^2(c^2 - b^2) + k^2 b^2(a^2 - c^2) + k^2 c^2(b^2 - c^2) \\ & = 0 \end{aligned}$$

2 (a)

Let  $\sin A = 3k, \sin B = 4k, \sin C = 5k$

$$\therefore \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c} = p \quad [\text{say}]$$

$$\Rightarrow \frac{3k}{a} = \frac{4k}{b} = \frac{5k}{c} = p$$

$$\Rightarrow a = 3\left(\frac{k}{p}\right), b = 4\left(\frac{k}{p}\right), c = 5\left(\frac{k}{p}\right)$$

$$\Rightarrow a = 3l, b = 4l, c = 5l \quad \left[\text{let } l = \frac{k}{p}\right]$$

$$\therefore \cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

$$= \frac{16 + 25 - 9}{2 \times 4 \times 5} = \frac{32}{40} = \frac{4}{5}$$

$$\therefore \cos B = \frac{c^2 + a^2 - b^2}{2ac}$$

$$= \frac{25 + 9 - 16}{2 \times 3 \times 5} = \frac{18}{30} = \frac{3}{5}$$

$$\text{Now, } \cos A : \cos B = \frac{4}{5} : \frac{3}{5} = 4 : 3$$

4 (b)

Slope of perpendicular to the line joining the points

$$(a \cos \alpha, a \sin \alpha) \text{ and } (a \cos \beta, a \sin \beta) = -\frac{\cos \alpha - \cos \beta}{\sin \alpha - \sin \beta}$$

$$= \tan \frac{\alpha + \beta}{2}$$

Hence, equation of perpendicular is

$$y = \tan \left(\frac{\alpha + \beta}{2}\right) x \quad \dots(i)$$

Now, on solving the equation of line with Eq. (i), we get

$$\left[\frac{a}{2}(\cos \alpha + \cos \beta), \frac{a}{2}(\sin \alpha + \sin \beta)\right]$$

5 (a)

$$\text{Area of } \frac{\Delta PBC}{\Delta ABC} = \left[ \frac{\{-3(-2-y) + 4(y-5) + x(5+2)\}}{\{6(5+2) - 3(-2-3) + 4(3-5)\}} \right]$$

$$= \left| \frac{7x + 7y - 14}{49} \right| = \left| \frac{x + y - 2}{7} \right|$$

6 (b)

Let  $PQ$  and  $RS$  be the poles of height 20 m and 80 m subtending angles  $\alpha$  and  $\beta$  at  $R$  and  $P$  respectively. Let  $h$  be the height of the point  $T$ , the intersection of  $QR$  and  $PS$

$$\begin{aligned} \text{Then, } PR &= h \cot \alpha + h \cot \beta \\ &= 20 \cot \alpha + 80 \cot \beta \\ \Rightarrow \cot \alpha &= 4 \cot \beta \\ \Rightarrow \frac{\cot \alpha}{\cot \beta} &= 4 \end{aligned}$$

$$\begin{aligned} \text{Again, } h \cot \alpha + h \cot \beta &= 20 \cot \alpha \\ \Rightarrow (h - 20) \cot \alpha &= -h \cot \beta \\ \Rightarrow \frac{\cot \alpha}{\cot \beta} &= \frac{h}{20 - h} = 4 \\ \Rightarrow h &= 80 - 4h \\ \Rightarrow h &= 16 \text{ m} \end{aligned}$$

8 (a)

Since,  $\alpha, \beta, \gamma$  are the roots of the equation

$$x^3 - 3px^2 + 3qx - 1 = 0$$

$$\therefore \alpha + \beta + \gamma = 3p$$

$$\alpha\beta + \beta\gamma + \gamma\alpha = 3q$$

$$\text{and } \alpha\beta\gamma = 1$$

Let  $G(x, y)$  be the centroid of the given triangle

$$\therefore x = \frac{\alpha + \beta + \gamma}{3} = p$$

$$\begin{aligned} \text{and } y &= \frac{\frac{1}{\alpha} + \frac{1}{\beta} + \frac{1}{\gamma}}{3} \\ &= \frac{\beta\gamma + \gamma\alpha + \alpha\beta}{3\alpha\beta\gamma} = q \end{aligned}$$

Hence, coordinates of the centroid of triangle are  $(p, q)$

9 (d)

Let  $O(0, 0)$  be the orthocenter,  $A(h, k)$  be the third vertex and  $B(-2, 3)$  and  $C(5, -1)$  the other two vertices.

Then, the slope of the line through  $A$  and  $O$  is  $\frac{k}{h}$ , while the line through  $B$  and  $C$  has the slope  $\frac{-1-3}{5+2} = -\frac{4}{7}$ .

By the property of the orthocenter, these two lines must be perpendicular, so we have

$$\left(\frac{k}{h}\right) \left(-\frac{4}{7}\right) = -1 \Rightarrow \frac{k}{h} = \frac{7}{4} \quad \dots(i)$$

$$\text{Also, } \frac{5-2+h}{3} + \frac{-1+3+k}{3} = 7$$

$$\Rightarrow h + k = 16 \quad \dots(ii)$$

Which is not satisfied by the points given in the options (a), (b) or (c)

10 (b)

Let  $(h, k)$  be the point

According to question,

$$4\sqrt{(h-h)^2 + k} = h^2 + k^2$$

$$\Rightarrow 4|k| = h^2 + k^2$$

Locus of the point is

$$4|y| = x^2 + y^2 \Rightarrow x^2 + y^2 - 4|y| = 0$$

12 (a)

Given points are  $P(4, -2), A(2, -4)$  and  $B(7, 1)$

Suppose  $P$  divides  $AB$  in the ratio  $\lambda : 1$ . Then,

$$\frac{7\lambda + 2}{\lambda + 1} = 4 \Rightarrow \lambda = \frac{2}{3}$$

Thus,  $P$  divides  $AB$  internally in the ratio  $2 : 3$

The coordinates of the point dividing  $AB$  externally in the ratio  $2 : 3$  are

$$\left( \frac{2 \times 7 - 3 \times 2}{2 - 3}, \frac{2 \times 1 - 3 \times -4}{2 - 3} \right) = (-8, -14)$$

Hence, the harmonic conjugate of  $R$  with respect to  $A$  and  $B$  is  $(-8, -14)$

13 (c)

If  $O$  is the origin and  $P(x_1, y_1), Q(x_2, y_2)$  are two points, then

$$OP \times OQ \cos \angle POQ = x_1x_2 + y_1y_2$$

$$\therefore OP \times OQ \times \sin \angle POQ$$

$$= \sqrt{OP^2 \times OQ^2 - OP^2 \times OQ^2 \times \cos^2 \angle POQ}$$

$$= \sqrt{(x_1^2 + y_1^2)(x_2^2 + y_2^2) - (x_1x_2 + y_1y_2)^2}$$

$$= \sqrt{(x_1y_2 - x_2y_1)^2} = |x_1y_2 - x_2y_1|$$

14 (c)

$$\cos B = \frac{(3)^2 + (5)^2 - (4)^2}{2 \times 3 \times 5} = \frac{3}{5}$$

$$\Rightarrow \sin B = \sqrt{1 - \frac{9}{25}} = \frac{4}{5}$$

$$\therefore \sin 2B = 2 \sin B \cos B$$

$$= 2 \times \frac{4}{5} \times \frac{3}{5} = \frac{24}{25}$$

16 (d)

Given that,  $\angle A = 45^\circ, \angle B = 75^\circ$

$$\angle C = 180^\circ - 45^\circ - 75^\circ = 60^\circ$$

$$\therefore a + c\sqrt{2} = k(\sin A + \sqrt{2} \sin C)$$

$$= k(\sin 45^\circ + \sqrt{2} \sin 60^\circ)$$

$$= k \left( \frac{1}{\sqrt{2}} + \sqrt{2} \frac{\sqrt{3}}{2} \right) = k \left( \frac{1 + \sqrt{3}}{\sqrt{2}} \right) \dots (i)$$

$$\text{And } k = \frac{b}{\sin B}$$

$$= \frac{b}{\sin 75^\circ} = \frac{2\sqrt{2}b}{\sqrt{3} + 1}$$

On putting the value of  $k$  in Eq. (i), we get

$$a + c\sqrt{2} = 2b$$

18 (d)

From figure  $ABCD$  is a square

Whose diagonals  $AC$  and  $BD$  are of length 2 unit

$$\text{Hence, required area} = \frac{1}{2} AC \times BD$$

$$= \frac{1}{2} \times 2 \times 2 = 2 \text{ sq units}$$

19 (c)

In  $\triangle APD$ ,

$$\tan 45^\circ = \frac{a}{AP} \Rightarrow AP = a$$

and in  $\triangle BPC$ ,

$$\tan 45^\circ = \frac{b}{PB}$$

$$\Rightarrow PB = b$$

$$\therefore DE = a + b \text{ and } EC = b - a$$

In  $\triangle DEC$ ,

$$DC^2 = DE^2 + EC^2$$

$$= (a + b)^2 + (b - a)^2$$

$$= 2(a^2 + b^2)$$

20 (b)

If the axes are rotated through  $30^\circ$ , we have

$$x = X \cos 30^\circ - Y \sin 30^\circ = \frac{\sqrt{3}X - Y}{2}$$

$$\text{and, } y = X \sin 30^\circ + Y \cos 30^\circ = \frac{X + \sqrt{3}Y}{2}$$

Substituting these values in  $x^2 + 2\sqrt{3}xy - y^2 = 2a^2$ , we get

$$(\sqrt{3}X - Y)^2 + 2\sqrt{3}(\sqrt{3}X - Y)(X + \sqrt{3}Y) - (X + \sqrt{3}Y)^2 = 8a^2$$

$$\Rightarrow X^2 - Y^2 = a^2$$
